Study Models

Stacked

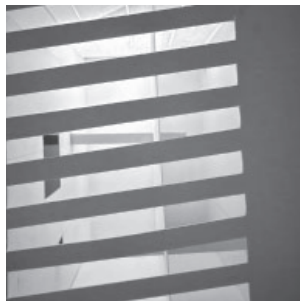

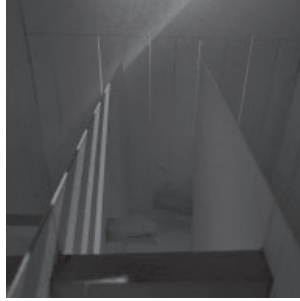

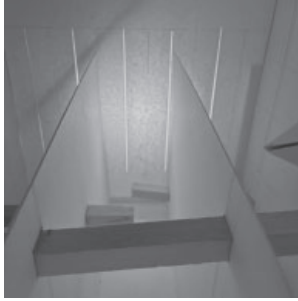

After selecting 3 different options, I created study models out of the concepts described.

25

Choosing one of the concepts from the contact sheet, I moved forward to design the study model while keeping light in mind. However, I chose to combine both the idea of stacking elements to create light as well as the idea of encroachment that was in the original contact sheet. Using overhanging elements I attempted to create captivating light.

Selected Photo for BMD

Final Model Exterior

After starting out with the light conditions of the Cal Poly campus, I described the photos of light in words. I selected a study model to expand on to create a more polished and concrete final model. More specifically, this included the addition of basswood. After creating the final model we created a Big Moody Drawing (BMD) out of the tradition of Hugh Ferriss to begin to describe our project through charcoal. That is project 2 in a nutshell. The project as a whole shows one way to go about the design process, which in the end stems from a design concept. In this case it was light and the light that surrounds the campus.

Project 2 Reflection

There is great beauty in light. That's the most important thing that I learned throughout this project. Learning how to see is one of the most important things in architecture school so far. Seeing shadow and light as conditions that can influence structure in the most interesting ways as possible.

project 3 (arboretum)

With the skills of precedent study and a fundamental understanding of perspective, we were asked to do a site analysis on the Cal Poly arboretum. The arboretum is varied in its structure as well as composition, which there lies plant life from Mediterranean climates around the world. It contains plants that have lasted decades and those that have yet to sprout. It is a place of living silence.
